In-line AXI (Automatic X-ray Inspection)

A new laminography and iTOP technology based on AI platform

Techvalley's flagship product range is the Hawkeye AXI, automated inspection solutions based on a unique AI Platform, fully developed in-house and with patents pending on key technologies.

The Hawkeye Series is a unique, revolutionary inspection solution to automatically determine the quality of PCBA's, combining ultra-high speed, accuracy and repeatability.

Laminography has long been accepted as the best solution for the automated x-ray inspection of PCBA's, but this product takes in-line inspection to a whole new level.

The i-TOP (Inspection Technology for Overlapped Patterns) is a unique algorithm processing technology based on artificial intelligence and uses only one image for the inspection. Traditional laminography techniques require five images or more. i-TOP accurately recognises defects that are challenging due to overlapping devices on double sided boards.

This increased throughput and improved accuracy maximises the efficiency of production lines and dramatically improves first time pass rate.

The Hawkeye Series is up to 70% faster than other systems, with a false call rate, down to below 3%. These numbers were proved in an evaluation using Samsung 5G products. The Hawkeye AXI is the perfect in-line x-ray inspection solution for complex double-sided assemblies and demanding packages including: SiP, PoP, SoP

The Hawkeye AXI Series functions perfectly as an automated inspection system without any human interaction. All data collected can be stored and exported into management information systems, therefore the Hawkeye AXI is fully ready for integration into Smart Factory and Industry 4.0 concepts.
